Education

Harvard Kennedy School, Cambridge, MA, United States — August 2021 – present
PhD in Public Policy (Economics)
Fields: Development Economics, Political Economy
Committee: Augustin Bergeron, Asim Ijaz Khwaja (chair), Eliana La Ferrara

Dartmouth College, Hanover, NH, United States — June 2019
B.A. in Economics, Minor in Statistics

Past experience

Center for Economic Research in Pakistan (CERP), Lahore, Pakistan — June – August 2022
Research Assistant to Asim Khwaja

Zell/Lurie Real Estate Center, Wharton, Philadelphia, PA — August 2019 – June 2021
Pre-Doctoral Research Assistant to Maisy Wong and Nina Harari

Dartmouth Economics Department, Hanover, NH — March 2017 – June 2019
Research Assistant to Eric Edmonds, Patricia Anderson, and Diego Comin

Edgeworth Economics, Washington, D.C. — June – August 2018
Economic Consulting Intern

Teaching

Harvard University, Cambridge, MA
Ec 10B: Principles of Macroeconomics; for David Laibson and Jason Furman — Spring '24, '25, '26
Ec 10A: Principles of Microeconomics; for David Laibson and Jason Furman — Fall '23, '25
Ec 1010A: Microeconomic Theory; for Maxim Boycko — Fall '24

Dartmouth College, Hanover, NH
Econ 44: Topics in Development Economics; for Eric Edmonds — Winter '19
Econ 49: Topics in International Economics; for Nina Pavcnik — Winter '19

Research Projects

From the Pulpit to the People: Experimental Evidence on the Impact of Friday Sermons
Winner of the Louis Pasteur Prize for Best PhD Student Paper, AFE Conference (UChicago)
Job Market Paper

I explore the role of religious institutions in shaping behavior by experimentally varying the content of Friday sermons—one of the most widespread forms of in-person religious persuasion in the Muslim world—in 309 mosques in Punjab, Pakistan. Working with the Punjab Auqaf Department that administers state religious properties, I randomize mosques to deliver sermons on women's rights, neighbors' rights, or a control condition, with additional variation in whether arguments are framed in religious or secular terms. I find sizable impacts of women's rights sermons (0.23 SD) and neighbors' rights sermons (0.19 SD) on men's beliefs and behavior as measured through lab-in-field games, field behavioral measures, and survey responses 2–4 weeks after treatments. I find suggestive evidence that effects extend downstream, with wives of husbands who received sermons on women's rights reporting more prosocial beliefs. Sermon content is more persuasive when grounded in religious arguments for women's rights but in secular arguments for neighbors' rights, consistent with a Bayesian framework modified to allow conservative religious priors to constrain updating from secular signals. Examining equilibrium dynamics, I document supply-side persistence in prosociality of sermon content alongside demand-side backlash as evidenced by a 20% decline in attendance numbers at mosques that received sermons on women's rights. Taken together, these findings highlight the continued centrality of religious institutions, such as the Friday sermon, in shaping behavior especially among highly religious populations.

Doctor's Orders vs Divine Wisdom

Low trust in secular state institutions can limit the effectiveness of informational interventions among religious populations. Recent work has suggested the potential for religious leaders to be utilized for information dissemination, but research directly comparing the efficacy of religious with secular leaders is lacking. Moreover, what, if any, are the unintended consequences of utilizing religious leaders as frontline agents tasked with achieving state goals? In this project, I explore the educational role of local leaders and compare the ability of local religious and secular leaders to encourage positive health behaviors in the context of a state-sponsored handwashing campaign in Punjab, Pakistan. In collaboration with the Pakistan Ministry of Health, I randomize Pakistani couples to meetings with either their local health worker or religious leader and then evaluate changes in hand hygiene, handwashing behavior, and beliefs about handwashing. Through lab-in-field games, I explore the micro-foundations for separation of Church and State by evaluating whether reliance on religious leaders for information dissemination makes them the preferred choice for information in the future, even on secular topics. In doing so, this work sheds light on the benefits and pitfalls of using religious leaders to achieve policy goals through state-sponsored information campaigns.

The Market for Religious Content: Evidence from Friday Sermons in Pakistan

What drives religious content? In this project, I explore this question from both the demand and supply side in the context of mosques in Punjab, Pakistan. On the demand side, I provide congregants with "content information" (i.e. sermon content of nearby mosques) or "mosque information" (i.e. amenities and congregation characteristics of nearby mosques) and evaluate impacts on mosque choice. On the supply side, I provide religious leaders with "market information" (i.e. congregants' preferences and sermon content of nearby mosques) or "top-down information" (beliefs of senior religious leaders) and look at endogenous changes to sermon content. Results have implications for policymakers seeking to understand the drivers of local hate speech and polarization and ways in which increased information can reduce the influence of controversial leaders.

Why Families Pay: Misperceptions and the Persistence of Dowry
with Abdullah Shahid

Dowry payments routinely amount to several times a household's annual income in many developing contexts, pushing families into debt and inviting marital violence on daughters. Existing work has largely neglected the role of beliefs in helping explain the persistence of dowry, despite how beliefs about what other households privately think of the practice, the religious acceptability of dowry, and what the payment buys a daughter, are crucial to the decision of how much to give and may each be systematically skewed. Working with a sample of households with soon-to-marry daughters in rural Punjab, Pakistan, we document the extent to which such misperceptions exist and whether information correcting beliefs can shift dowry decisions. We document misperceptions by comparing individuals' beliefs to ground truths constructed from surveys of the local population, randomize households to a correction of each of these three beliefs, and evaluate changes in realized dowry payments. Results have implications for the optimal design of anti-dowry policy.
